

## ABSTRACT OF THE DISCLOSURE

A homepage access method using lottery numbered e-mails for network users only, which allows a great improvement in the number of accesses to a homepage with extremely low costs. Terminal devices 1a to 1d such as personal computers, mobile telephones, and so on access a server 10 having a homepage for sending/receiving e-mails over a network 11. Then, when the terminal devices 1a to 1d start up a mailer on the homepage in order to send an e-mail, a mail sending portion 13 writes a lottery number and an address of the homepage at the end of the e-mail and then sends the mail to a mail receiver. The receiver accesses the homepage in order to check whether the lottery number written in the e-mail wins or not. This increases the number of accesses for the homepage.
